AICRP on Forage Crops, Centre for Forage Management, Agricultural Research Station, S. K. Rajasthan Agricultural University, Bikaner-334 006, Rajasthan, India

E-mail: surendrashekhawat884@gmail.com

Abstract

Rajasthan is the largest state of India and covers nearly 10.4 per cent (342.65 lakh ha) of total geographical area of the country. According to livestock census-2007, Rajasthan ranks at the third place in the country for total livestock population. The large livestock population of the state shows importance of fodder in the state. Under AICRP on Forage Crops and Utilization, many improved varieties of fodder crops and techniques of improved fodder production have been recommended for cultivation to farmers. Important green fodder crops of this region are, viz. peal millet, cowpea, cluster bean and sorghum in Kharif season and oats, lucerne and barley (dual purpose) during Rabi season. Three perennial fodder grasses, viz. *Lasiurus sindicus, Cenchrus ciliaris* and *Cenchrus setigerus* are important in the region. Guinea grass and bajra x napier hybrid can also be cultivated where sufficient water is available throughout the year from canal irrigation or tube wells. New varieties developed from Bikaner centre are, viz. Raj Bajra-1 of pearl millet, Krishna of lucerne, Bikaneri Dhaman of *Cenchrus ciliaris* and Jaisalmeri Sewan of *Lasiurus sindicus*. Breeder seed production of pearl millet and oat was done in the past as per the indent received.

Introduction

Rajasthan is the largest state of India and covers nearly 10.4 per cent (342.65 lakh ha) of total geographical area of the country. About 65 per cent of its population is dependent on agriculture. According to livestock census-2007, Rajasthan ranks at the third place in the country for total livestock population (56.663 million) after Uttar Pradesh (60.272 million) and Andhra Pradesh (60.175 million). The large livestock population of the state shows importance of fodder in the state. Rajasthan state has 10 agro-climatic zones and agriculture is mainly rainfed (Figure 1). Out of total geographical area of 342.65 lakh ha, 26.75 lakh ha is under forests, 42.62 lakh ha is not available for cultivation and 63.19 lakh ha is other uncultivable land (excluding fallow land). The total cultivable area is around 220.00 lakh ha. According to State Agriculture Policy (2013), the state has about 17.07 lakh ha of land under permanent pastures for grazing and this area under pasture is not able to meet total fodder requirement of present livestock population. So, fodder security for this increasing livestock population will be ensured by promoting fodder crops and fodder and feed storage systems. Silvipastoral practice will be promoted in the arid western Rajasthan.

Forage crops and grasses are important in arid region of Rajasthan state of India because most of the area is rainfed. Main occupation of the farmers in the area is animal husbandry. Important green fodder crops of this region are, viz. peal millet, cowpea, cluster bean and sorghum in Kharif season and oats, lucerne and barley (dual purpose) during Rabi

season. Three perennial fodder grasses, viz. *Lasiurus sindicus*, *Cenchrus ciliaris* and *Cenchrus setigerus* are important in the region. Guinea grass and bajra x napier hybrid can also be cultivated where sufficient water is available throughout the year from canal irrigation or tube wells. Priority for forage crops and grasses of the region is as follows:

| Region | Priority I | Priority II | Priority III |
|--|--|--|--|
| Arid* | <i>Lasiurus sindicus</i> , moth, pearl millet | Guar | Other range grasses and legumes |
| Semi-arid** | Cenchrus ciliaris, Cenchrus setigerus, Panicum antidotale, pearl millet, sorghum, guar, lucerne | <i>Dihcanthium</i> <i>annulatum</i> , maize, NB hybrid, o at, cowpea | Other forage crops like barley, etc. |
| Canal irrigated areas in arid and semi arid areas | Lucerne, maize | Berseem, guinea grass, NB hybrid | |

Table 1: Priority crops of the region

* In arid areas, *Prosopis cineraria* and *Z. nummularia* to be incorporated in the system.

** Ailanthus excelsa to be integrated as tree component.

Table 3: Land utilization in Rajasthan (2011-12)

| S. No. | Category | Area in hectare | % |
|--------|--|-----------------|------|
| 1 | Total area for land use | 34267252 | 100 |
| 2 | Forest | 2746686 | 8.02 |
| 3 | Permanent pastures and other grazing lands | 1693790 | 4.94 |

(Source: Agricultural Statistics, 2011-12, Directorate of Economics and Statistics, Rajasthan)

Table 3 shows that 4.94% of total area of the state is under permanent pastures and other grazing lands, which also provide fodder to the animals.

Forage Crop Improvement

Breeding objectives

- 1. Identification and generation of breeding material of range grasses (*Lasiurus sindicus, Cenchrus ciliaris, Cenchrus setigerus*, etc.), pearl millet and lucerne.
- 2. Identification of high yielding strains of fodder crops.

| Crop/ Grass | Variety | Year of | Green fodder | Area for which |
|-------------------|-------------|---------|-----------------|------------------|
| | | release | yield potential | recommended |
| | | | (approx. q/ha) | |
| Pearl millet | Raj Bajra-1 | 2015 | 500 | Whole Rajasthan |
| Cenchrus ciliaris | Bikaneri | 2015 | 200 | Whole Rajasthan |
| | Dhaman | | | |
| Lucerne | Krishna | 2016 | 300 (annual) | North West India |
| | | | 800 (Perennial) | |
| Lasiurus sindicus | Jaisalmeri | 2016 | 200 | North West India |
| | Sewan | | | |

Varietal Improvement

Variety RBB-1 (Raj Bajra-1) of pearl millet and RCCB-2 (Bikaneri Dhaman) of *Cenchrus ciliaris* developed at Bikaner centre have been released at state level in Rajasthan in 2015. RRB-07-1 (Krishna) variety of lucerne developed at Bikaner centre has been released for release for North West zone of the country in 2016. RLSB-11-50 (Jaisalmeri Sewan) variety of *Lasiurus sindicus* grass has been released for North West zone of the country in 2016. Inluding these four varieties, developed at Bikaner centre, the following other varieties of forage crops and grasses are recommended for cultivation on the basis of superior performance observed in varietal trials conducted at Agricultural Research Station, Bikaner and/or their suitability:

- 1. Pearl millet: Raj Bajra-1, Giant Bajra, RBC-2
- 2. Sorghum: Raj Chari-1, Raj Chari-2 for single cutting

SSG-59-3 for more than one cutting

- 3. Cowpea: Bundel lobia -1, Bundel lobia -2, UPC-5286
- 4. **Cluster bean**: Bundel guar -1, Bundel guar -3
- 5. Oat: Kent, OS-6
- 6. Lucerne:Krishna, RL-88, Anand-2
- 7. Berseem: Mescavi, Wardan
- 8. Barley (Dual purpose): RD-2552, RD-2035, RD-2715
- 9. Cenchrus ciliaris: Bikaneri Dhaman, CAZRI-75
- 10. Sewan grass: Jaisalmeri Sewan

With cultivation of the forage crops, grasses and legumes, growing of their improved varieties with their quality seed is important like other cultivated crops to get their more

production and good quality. Genetic improvement work for forage crops and grasses for arid region of Rajasthan is being done at Agricultural Research Station, SKRAU, Bikaner under AICRP on Forage Crops. Main challenge in range grasses to develop improved varieties is presence of apomixis. Due to presence of apomixis, new variability through crosses is difficult to be created. Genetic improvement in the forage crops and grasses is mainly being done for higher fodder productivity with better quality but, in future, work on other aspects like climate change will also be required. For developing varieties under changed climate conditions, screening of the genotypes under different dates of sowing will be required to know their suitability under different temperature conditions.

Germplasm

At this time, Bikaner centre has mandate for breeding work related to range grasses. So, germplasm of important range grasses is being maintained and evaluated at Bikaner centre.

IC Nos. from NBPGR: IC Nos. were obtained for 35 *Cenchrus ciliaris* germplasm entries from NBPGR, New Delhi. The numbers are IC-551555 to IC-551589.

Forage Production Technologies

The following improved fodder production technology have been recommended for farmers based on the agronomy experiments conducted under AICRP on Forage Crops:

- Dual purpose barley gave significantly higher green fodder and grain yield with application of nitrogen as 2/3 basal + 1/3 immediate after first cut under canal irrigated condition. While nitrogen when applied 1/2 basal +1/4 immediate after first cut 1/4 after next irrigation (tillering after cut) recorded significantly higher green fodder yield and grain yield with sprinkler irrigation system under light soil of western Rajasthan.
- Application of 25 % nitrogen through FYM and 50 % NPK through inorganic fertilizers + biofertilizers resulted significantly the highest green fodder yield, grain yield and economic returns under Sorghum _{fodder} + Moth _{grain} + Oat _{grain} + Lucerne_{fodder} fodder crop sequence.
- Application of Zn through zinc sulphate applied either every year or alternate year gives good response in terms of green fodder yield of cowpea and grain yield of barley in western Rajasthan.
- Forage production potential of sorghum + clusterbean inter crop with 100% seed rate of legume recorded the highest fodder yield and net returns under western Rajasthan
- Pearl millet + guar Oat Cowpea sequence has been found remunerative, which gave higher forage production and net returns on sustainable basis.
- For higher economic returns, oat crop should be left for seed production after one cut for green fodder at 75 days after sowing.
- For obtaining higher green fodder yield during kharif season, pearl millet should be grown in combination with guar in 2:2 or 1:1 row proportion or with cowpea in 2:2 row proportion.

- October 30 November 10 is optimum period for sowing of fodder oat. Under good management condition, three cuts for green fodder can be taken.
- October 30 is optimum date of sowing for lucerne and for getting higher green fodder production. Cutting should be taken at three weeks' interval.

Seed Production and Availability

Bikaner centre is doing breeder seed production of fodder varieties of pearl millet, oat and cluster bean according to the indent received. Mainly, breeder seed production of RBC-2 variety of pearl millet and Kent variety of oat has been done in the past years.

| Year | Crop | Variety | Breeder seed indented | Produced by |
|---------|--------------|----------|-----------------------|-------------|
| | | | by DAC | breeder (q) |
| | | | (q) | |
| 2008-09 | Pearl millet | RBC-2 | 1.75 | 2.00 |
| | Oat | Kent | 23.00 | 55.00 |
| 2009-10 | Pearl millet | RBC-2 | 0.35 | 0.35 |
| | Guar | RGC-1031 | 40.00 | 43.00 |
| | Oat | Kent | 10.00 | 34.00 |
| 2010-11 | Pearl millet | RBC-2 | 0.50 | 0.50 |
| | Oat | Kent | 12.50 | 27.53 |
| 2011-12 | Pearl millet | RBC-2 | 0.50 | 0.50 |
| 2012-13 | Pearl millet | RBC-2 | 0.20 | 0.20 |

Future Strategies

Although good varieties of the forage crops and grasses are available at this time for the region, there is high need for the region to get more and continuous attention for genetic improvement of forage crops with their quality seed production for sustainable livestock production. Bikaner centre of AICRP on Forage Crops is at present an important centre for breeder seed production of fodder pearl millet and oats. Research efforts have revealed that seed production of lucerne can be done in areas around Bikaner region with production of about 2.5 q/ha seed. Farmers should take advantage by growing improved varieties of fodder grasses and crops and following improved technology of fodder production.
